

Turning big moments into repeatable Coca-Cola occasions in India

A consumer-growth strategy built around personalization, affordability and measurable repeat

180M+

servings reported at the
2025 Maha Kumbh
activation

The growth opportunity is not one more campaign

It is an occasion-to-habit system.

Use the reach of a festival, campus moment or group celebration to create trial. Then give the shared drink a clear second occasion, an available pack and a reason to return.

The logic

- 1 Win a real occasion
- 2 Make the pack personally relevant
- 3 Prompt a second group moment
- 4 Measure transactions and repeat

This is a testable growth loop, not a claim about Coca-Cola's internal strategy.

The public signal is a spike, not yet proof of a habit

My inference

The activation clearly created reach. The full-year number makes repeat the more valuable question. These periods are not directly comparable, so the answer needs an experiment, not a confident story.

Personalization works when the pack becomes a social object

SELF CUE

This feels like mine

Self-referential processing can make brand information easier to remember.

OWNERSHIP

I helped choose it

A study on adding a customer's name to a standard product linked the effect to psychological ownership and product attitude.

SHARING

This is for someone

Share a Coke turns packaging into an invitation to give, post or start a group moment.

Design implication

Do not stop at printing names. Tie the cue to a real relationship and a second occasion that can be observed at the outlet.

The missing bridge sits between the first share and the second buy

Test the bridge. If the second buy does not move, the growth loop has not formed.

Run a pilot that can be measured, not admired

CELL	TREATMENT	WHAT CHANGES
A	Business as usual	Current assortment, display and communication
B	Personalized occasion cue	Locally reviewed name, role or relationship cue
C	Cue plus repeat loop	Group-share prompt and an opt-in return mechanism

Randomize at outlet cluster level, balance baseline transactions and availability, and pre-register the readout before creative goes live.

Judge the pilot on transactions and repeat

Primary metric

**Incremental
transactions per
eligible outlet**

Compared with the balanced control group
over the agreed test window

30-day repeat

Did the second occasion happen?

Gross margin after activation

Did the lift pay for the treatment?

Stock availability

Could the outlet execute the idea?

Opt-in share behaviour

Did people use the social
mechanism?

Retailer compliance

Was the test actually delivered?

A scan-rate spike without transaction lift is not a win.

Availability and entry-pack economics decide whether the idea scales

\$47.9B

2025 net operating revenue

\$5.4B

2025 advertising expense

130M+

juice transactions added year to date through
lower-cost single-serve offers in markets including
India and Latin America

My commercial rule

Choose the package, price point and message together, using outlet economics. Do not bolt a creative idea onto a pack that is unavailable or unaffordable in the target moment.

The 130 million figure relates to juice drinks and multiple markets. I use it as a revenue-growth-management signal, not as a forecast for this pilot.

Ninety days is enough to accept, refine or stop

Decision: scale, redesign or stop. A polished activation is not the output. A better growth decision is.

Build an occasion-to-habit engine

- 1 Start with a real local moment
- 2 Use personalization to make the pack socially relevant
- 3 Scale only when transactions, repeat and margin move together
