

Turning big moments into repeatable Coca-Cola occasions in India

A three-cell outlet test for personalization, repeat purchase and unit economics

180M+

servings reported at the
2025 Maha Kumbh
activation

Turn one high-reach occasion into a second purchase

Link the first shared drink to a clear return occasion.

A festival, campus moment or group celebration can create trial. Repeat depends on a second occasion, an available pack and a simple reason to return.

The logic

- 1 Win a real occasion
- 2 Make the pack personally relevant
- 3 Prompt a second group moment
- 4 Measure transactions and repeat

The outlet test measures whether the second occasion changes purchases.

The public evidence raises a repeat-purchase question

My inference

The activation created reach. The full-year result makes repeat worth testing. Because the reporting periods differ, the conclusion should come from an outlet experiment.

Personalization creates a cue people can recognize and share

SELF CUE

This feels like mine

Self-reference can make brand information easier to remember.

OWNERSHIP

I helped choose it

Adding a customer's name may build psychological ownership and improve product attitude.

SHARING

This is for someone

Share a Coke turns the pack into an invitation to give or start a group moment.

Design implication

Tie the name or role to a real relationship and a second occasion that can be observed at the outlet.

The repeat mechanism needs five linked steps

The second purchase decides whether the loop is working.

Test three outlet treatments

CELL	TREATMENT	WHAT CHANGES
A	Business as usual	Current assortment, display and communication
B	Personalized occasion cue	Locally reviewed name, role or relationship cue
C	Cue plus repeat loop	Group-share prompt and an opt-in return mechanism

Randomize at outlet cluster level, balance baseline transactions and availability, and pre-register the readout before creative goes live.

Judge the pilot on transactions and repeat

Primary metric

**Incremental
transactions per
eligible outlet**

Compared with the balanced control group
over the agreed test window

30-day repeat

Did the second occasion happen?

Gross margin after activation

Did the lift pay for the treatment?

Stock availability

Could the outlet execute the idea?

Opt-in share behaviour

Did people use the social
mechanism?

Retailer compliance

Was the test actually delivered?

A scan-rate spike matters only if transactions also move.

Availability and entry-pack economics decide whether the idea scales

\$47.9B

2025 net operating revenue

\$5.4B

2025 advertising expense

130M+

juice transactions added year to date through
lower-cost single-serve offers in markets including
India and Latin America

Commercial rule

Choose the package, price point and message together using outlet economics. The target pack must be available and affordable in the chosen moment.

The 130 million figure covers juice drinks across several markets. It is a revenue-growth-management signal for pack choice, not a pilot forecast.

Ninety days is enough to accept, refine or stop

Use the readout to scale, revise or stop the treatment.

Test one occasion, then scale on repeat and margin

- 1 Start with a real local moment
- 2 Use personalization to make the pack socially relevant
- 3 Scale only when transactions, repeat and margin move together
